

ECOVIBE: APPLICATION FOR SELLING AND BUYING SECOND-HAND CLOTHES

DESCRIPTION

EcoVibe is a software design and development project aimed at creating an online platform for buying and selling second-hand clothing. It focuses on ease of use and an intuitive user experience

User Registration and Authentication: Users can securely create accounts with encrypted credentials and JWT-based authentication.

Product Listing and Management: Sellers can upload images, descriptions, and prices, and manage their inventory efficiently.

Basic Search by Name: Buyers can search for products using keywords to find relevant listings.

Reviews and Ratings System: Buyers can leave reviews and rate sellers, helping build trust within the platform.

SOFTWARE ARCHITECTURE

User Interface (Frontend): Facilitates user interaction through forms and an intuitive search system.

Business Logic (Backend): Backend Logic: Handles user authentication, product listing, review system, and account management.

User stories

Interaction with potential users through surveys was key to understanding which functionalities to prioritize in the application. Both its logic and its design are striking and intuitive.

The goal is to develop an application that enhances user experience, guided by insights from potential user surveys. The focus is on balancing functionality and simplicity to create an intuitive interface without overwhelming the application.

The application will support the reuse of clothing, promoting a circular economy and reducing environmental impact.

PURPOSE

Acquire knowledge in advanced programming, system design based on Object-Oriented Programming (OOP), and good software development practices. The project focuses on applying solid documentation practices and following quality standards to ensure code maintainability while prioritizing application security.
